Names of the Team Members:

Fatih Bayazıt

Mehmet Umur Özü

Kübra Arslan

Emre Karadoğan

Project Description (1-2 paragraphs):

Invisio is an AI-powered photo editing platform designed to deliver advanced image enhancement capabilities through an intuitive and user-friendly web interface. Unlike traditional photo editing tools that often require technical expertise and manual adjustments, Invisio emphasizes simplicity and automation by integrating state-of-the-art deep learning models directly into the editing pipeline. The platform allows users to perform complex operations such as unwanted object removal, background replacement, facial enhancement, lighting and color correction, artistic style transfer, and intelligent filter recommendations with minimal user effort.

The project targets the increasing demand for accessible and efficient photo editing solutions, particularly among social media users, content creators, and e-commerce sellers. Invisio leverages publicly available datasets and, when necessary, synthetically generated data to train and fine-tune its AI models, ensuring robustness and high visual quality. Beyond technical performance, the project places strong emphasis on usability, scalability, and ethical data handling. By combining automation, visual accuracy, and ease of use, Invisio aims to bridge the gap between professional-grade image processing and everyday user needs.
